

10D-V

Voltage Input Analog, Sensor-to-Digital Front End Signal Conditioner

DESCRIPTION

10D-V analog voltage input modules are designed to interface with a wide range of sensors and equipment used in industrial test and measurement applications that output voltage signals.

Each module provides a single channel of differential analog voltage input that is filtered, isolated, amplified, and converted into 24-bit digital data for precise measurement of voltage signals.

Discrete output pins can be mapped to configurable low and high alarms to provide essential monitoring and warning functions to ensure optimum process flow and fail-safe operation.

Input-to-digital isolation is rated at a robust 1500Vrms and all field-side inputs are protected against accidental power-line connections up to 240Vrms. These features safeguard measurement and control equipment from the harmful effects of signal noise, transient surges, ground loops, and other industrial hazards.

Over-range and under-range up to 10% beyond specified input values are supported with accuracy guaranteed to $\pm$ full-scale. All 10D modules are housed in rugged thermoplastic packages and are specified to operate over the industrial temperature range of -40°C to $+85^{\circ}\text{C}$.

FEATURES

- Interface to Volt-level Signals
- 1 Input Channel
- Configurable for Alarms and Averaging
- 1500Vrms Input-to-Digital Isolation
- Input Protected up to 240Vrms
- CE Compliant
- 24-Bit Resolution
- Operating Temperature: -40°C to $+85^{\circ}\text{C}$

BENEFITS

- Small Footprint
- Simplifies Sensor Interface and Signal Conditioning Design
- Reduces System BOM
- Provides Isolation of External Sensors
- Protects Sensitive System Components
- Breaks Ground Loops
- Reduces EMC Concerns

APPLICATIONS

- Signal Conditioning
- Signal Isolation
- Signal Filtering
- Industrial Process Control
- Test and Measurement
- System and Signal Monitoring
